What is Pterygium?

A growth that starts on the clear tissue of the eye that can spread to the **Cornea**. The noncancerous, triangular growth may occur on one or both eyes. It's more common in people who spend a lot of time in the sun, such as those who work outdoors.

The growth may be slightly raised and contain obvious blood vessels. Common symptoms include:

- Eye discomfort
- Growth in the eye
- Irritation, or redness
- Blurred vision

A protective cover that supports the body's healing process after **Pterygium** surgery

An amniotic membrane covering that may help your body restore its damaged tissue

Bio Vance® 3L

HUMAN AMNIOTIC MEMBRANE ALLOGRAFT

Ask your doctor if BIOVANCE®3L Ocular is right for you

What is BIOVANCE•3L?

BIOVANCE•3L Ocular is a human amniotic membrane that uses the power of placental tissue to support your body's natural ability to heal. The thin, flexible membrane is placed on the surface of your eye to serve as a protective covering.

BIOVANCE•3L Ocular helps protect and support healing of the ocular surface. As a barrier membrane, it protects the eye from the eye lid. This may help reduce eye irritation.*

BIOVANCE•3L's unique design:

Promotes **patient comfort** with no outer ring or ridge

Is **fully absorbable** – eliminating the need for a repeat visit to have synthetic material removed

Provides a favorable environment for **cell growth** – the first step in natural healing*

*Data on file.

The Power of Placental Tissue

Benefits of the **unique properties of human amniotic membrane** were first discovered in ophthalmology as early as 1940.¹

The membrane goes through extensive screening and is processed according to the Food & Drug Administration (FDA) and American Association of Blood Banks (AABB) requirements. When applied to your eye, the extracellular matrix provides a natural scaffold that allows for your body's own cells to attach and repair the damaged eye tissue.

Complications that may be associated with Pterygiums

- A pterygium can lead to **severe scarring** on your cornea. Although rare, this can be serious.
- Scarring on the **cornea** needs to be treated surgically because it can cause inflammation and subsequent vision loss.
- In the more serious cases, treatment can involve **surgical removal** of the pterygium. This surgery would include removal of any scarring.
- Your doctor may recommend surgery to remove the pterygium if eye drops or ointments don't provide relief.
- The application of **Biovance 3L** will be administered once the pterygium is removed.

In Preparation/Following Application

Before Application:

Talk to your doctor if you have hyper-sensitivity to BIOVANCE•3L or if you have an infection prior to the application of BIOVANCE•3L.

Follow All Instructions:

Be sure to follow all instructions given to you by your health care provider, including taking all prescribed medications.

BIOVANCE•3L is absorbed by your body so it does not have to be removed. However, when you return to the office within 3-5 days for follow up, your health care provider will need to remove the bandage contact lens or other materials used to hold the product in the desired location.

Keep All Appointments:

Always keep your scheduled appointments with your health care provider.

Contact your eye doctor right away if you feel pain, or have swelling, redness, or any discharge.

Most insurance companies cover the cost of BIOVANCE•3L. Learn more from your doctor today.
